

Ludwig sensors are a New addition to the Fakopp 3D Arborsonic Tomograph range.

They are intermediate Arborsonic sensors and just like Beethoven, even though being deaf they make a Perfect Sound, which is detectable by the main sensors. These work with the latest free software update.

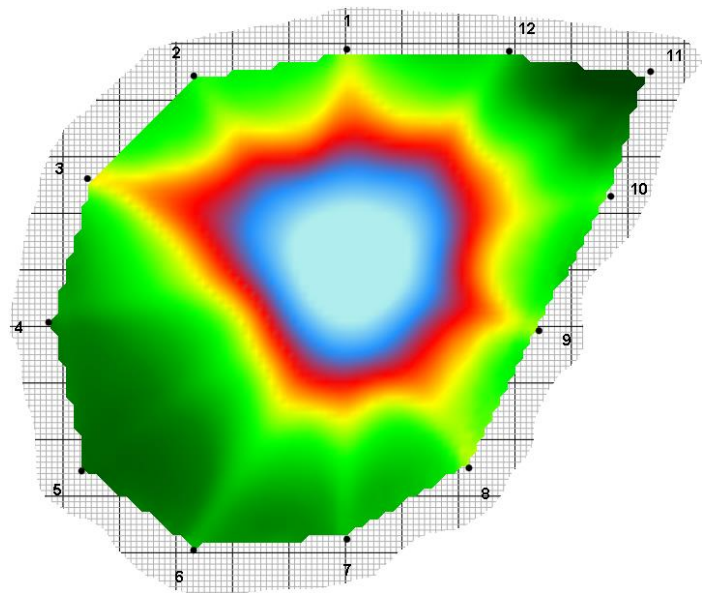

Ludwig sensors provide enhanced geometry information.

Improve the accuracy of Tomograms and improve Safety Factor calculations.

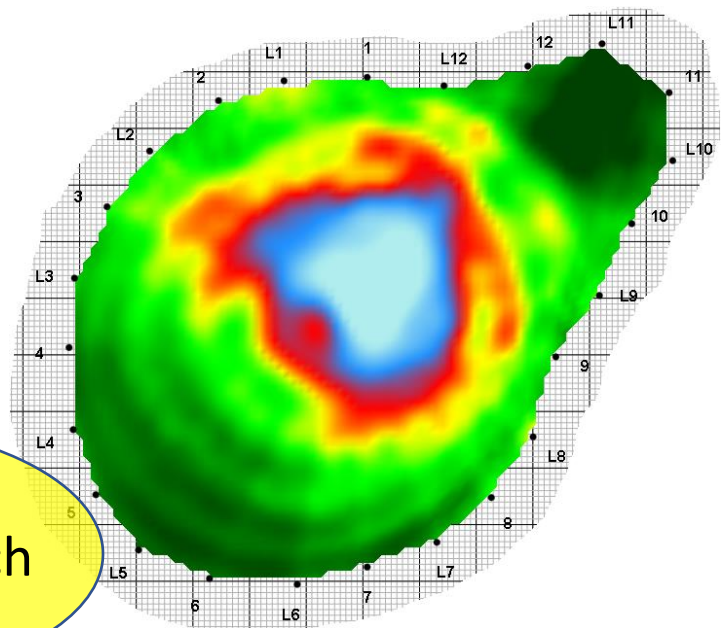

They can be turned on and off to compare Tomograms, which can be used to generate separate Safety Calculations without losing any data.

Better still they are a fraction of the cost of additional Piezo sensors meaning you can significantly enhance your scan details, and get a better representation of the internal condition of suspect trees more affordably.
